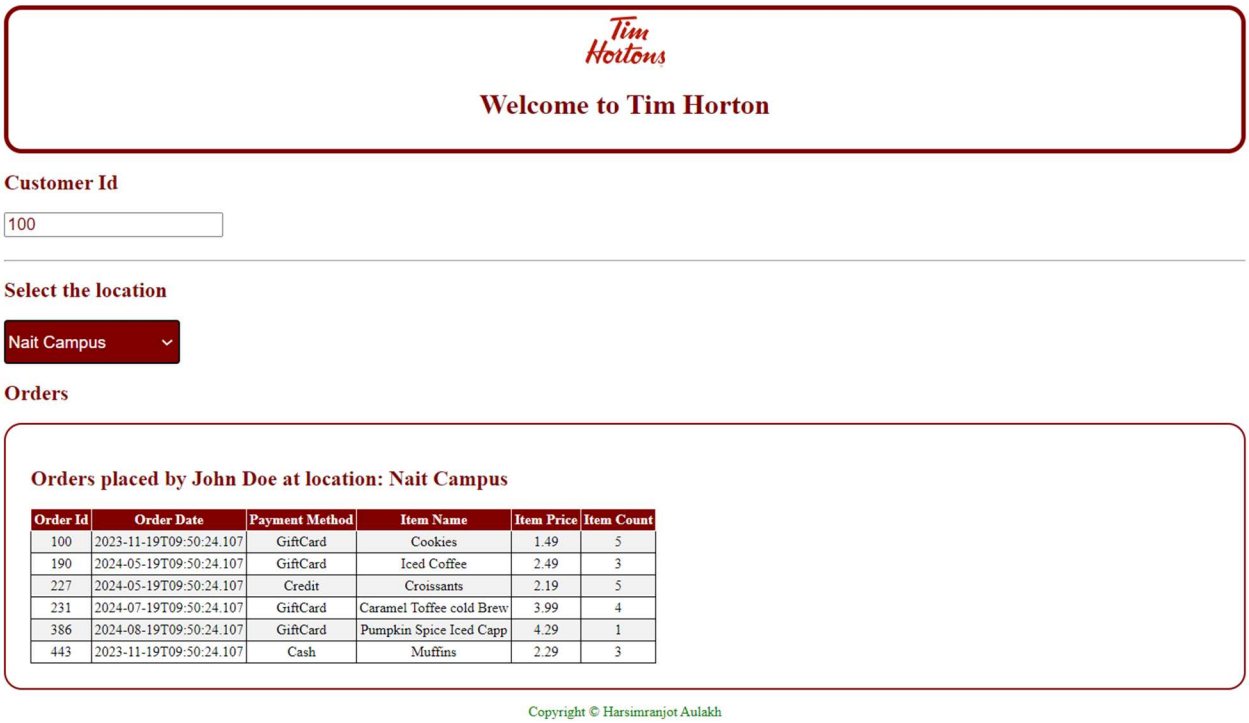
CMPE2550 – ICA10 [ASP] – Data Retrieval

In this exercise, you will incorporate ASP Core functionality, connection to database. You will begin your familiarity with the Microsoft SQL Server management Studio and use ASP Core and Linq to execute retrieval queries against database.

Tim Hortons requires a basic page from where the user can obtain information regarding orders placed by them on different locations. Therefore, to help them you need to design a web solution for this. An example layout and very simple style has been shown below, but it is not mandatory to replicate exactly. Feel free to be artistic as you please, **but it is advised to focus on the functionality first.**



Create a new ASP Assignment 10 folder. You will require at least 4 files (exact names not required):

index.html This file will be your landing page.

script.js This page will process the actions from the index.html page.

style.css This page will be used to contain style information that may be required by the application logic.

Web Service This will be a service file(s)/ ASP.NET Core project containing data of the application.

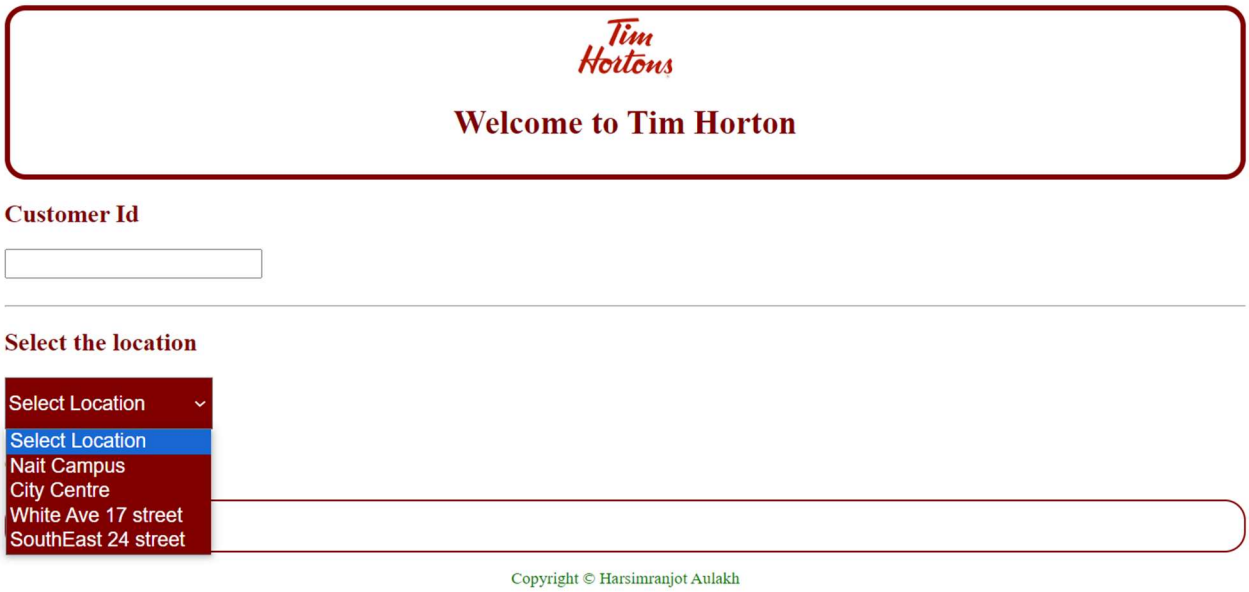
Or you can create an ASP.NET Core project and then create client-side files under a folder. It is demonstrated in the demo as well.

Restaurant Database

You will have been shown in class how to link your databases into ASP Core files. Make your own copy of Restaurant Database using the provided script.

Data Retrieval and Display

To retrieve orders, customer has to provide customer id and select a location, so for that make another Ajax call to on page load to bring different locations of Tim Horton from Database. Use any loop to construct a drop-down list of possible locations. Refer to picture above.



When user provides Customer Id [It is mandatory to provide otherwise give a appropriate alert message and change the focus to Customer Id field] and select a location from the drop-down list, make another call to bring the orders placed by user with provided Customer Id at selected location from the database.

Show the order details as shown in the screenshot. Feel free to pick your own design style, but it should not only be data.

Orders placed by John Doe at location: Nait Campus

Order Id	Order Date	Payment Method	Item Name	Item Price	Item Count
100	2023-11-19T09:50:24.107	GiftCard	Cookies	1.49	5
190	2024-05-19T09:50:24.107	GiftCard	Iced Coffee	2.49	3
227	2024-05-19T09:50:24.107	Credit	Croissants	2.19	5
231	2024-07-19T09:50:24.107	GiftCard	Caramel Toffee cold Brew	3.99	4
386	2024-08-19T09:50:24.107	GiftCard	Pumpkin Spice Iced Capp	4.29	1
443	2023-11-19T09:50:24.107	Cash	Muffins	2.29	3

You should avoid displaying an empty table when this occurs, and instead just show a status message indicating no records were found.

Note: This will be a living document as it is the first time it is being delivered. If typos are encountered, or an explanation is not clear or seems incomplete, please approach your instructor about it so that the feedback may be passed to the document creator. If the fix is complex enough, this document will be added to or changed, and the class alerted. Do keep in mind that you are expected to do some of the thinking and specific design, so this document has not been designed as a step-by-step recipe for completing the assignment, but more intended as a discussion of the requirements.
